

**INDEPENDENT CLAIMS FOR PERPETUAL
MOTION FAN MODULE**

What I claim is the independent means to produce perpetual motion within a battery operated device by eliminating the need for a separate charging operation comprising:

- (a) providing DC motors with means to increase torque enough to perform all needed work and having means to**
- (b) performing operation of charging components at speed enough to produce enough volts and amperes to overcome friction and charge**
- (c) operating batteries which are connected in series to achieve desired volts and are refurbished separately one at a time by its own charging component and are installed in**
- (d) housing capable of separating circuits with meters switches fuses lights and computer to monitor protect and control said device whereby as said device is operated said charging components refurbishes said batteries thereby said process which is an improvement over prior art attempts establishes perpetual motion.**
